JENKINS CI PIPELINE

3.1 Decisionengine modules CI with Jenkins pipeline

Jenkins dashboard with Decisionengine modules CI results is available [here](#).

A CI build is triggered any time a PR is created/closed or a commit is made to an existing PR. There are also *nightly CI builds* to test a list of predefined branches.

The Jenkins pipeline runs *pep8*, *pylint* and *unit_tests* test suites alongside the *rpmbuild* stage. The Jenkins dashboard looks like this:

Jenkins > CI > decisionengine_modules_pipeline

On the bottom left side there is the list of recent CI builds that are named after the PR or the branch tested.

On the bottom right side the dashboard shows for each CI build detailed status for each test suite.

Hovering the mouse over the *status box* for each CI build stage, a tool-tip with a button to access log details shows up.

Next to the build number the symbol  gives access to a menu with the list of artifacts stored for that build. Those artifacts include logs and the tarball with RPMs.

From the panel on the left side it is possible to access the PR on GitHub by clicking on the PR icon that looks like this  **#258**.

On occasion it could be useful to trigger a manual CI build to test a branch on the official DE GitHub repository or on the user fork. For this purpose, on the top left panel the user can click on the  **Build with Parameters** button, and this panel shows up

Pipeline decisionengine_modules_pipeline

This build requires parameters:

| | |
|----------------|---|
| DOCKER_IMAGE | <input type="text" value="vitodb/decision-engine-modules-ci;jenkins"/> Docker image name to use. Default is: vitodb/decision-engine-modules-ci;jenkins |
| DE_MOD_REPO | <input type="text" value="https://github.com/HEPCloud/decisionengine_modules/"/> Decisionengine modules repo. Default is: https://github.com/HEPCloud/decisionengine_modules/ |
| BRANCH | <input type="text" value="master"/> Branch to test. Default is: master |
| PYTEST_TIMEOUT | <input type="text" value="300"/> Timeout in seconds for unit_tests (it applies to individual unit test) Default is: 300 |

Build

the user can modify these parameters to customize what code to test with the CI build.

The *DE_MOD_REPO* parameter can point to the user fork or to the main repository.

The *BRANCH* parameter can point to the desired branch to test.

The *PYTEST_TIMEOUT* parameter is the timeout in seconds for *unit_tests*.

When ready, by clicking on the *Build* button, the CI build will start.

The [pipeline configuration](#) is part of the decisionengine_modules repo.

3.1.1 Nightly CI build configuration

The nightly CI build for Decisionengine framework uses this [Jenkins project](#) that triggers a CI build using the Jenkins pipeline described above to test a list of predefined branches.

Branches to test are defined using the project matrix as shown in the picture below. Each branch in the list (here *master* and *1.4*) spawns an independent CI build.

The screenshot shows the Jenkins Configuration Matrix configuration page. The 'Configuration Matrix' tab is selected. Under the 'User-defined Axis' section, the 'Name' field is set to 'BRANCH' and the 'Values' field is set to 'master 1.4'. There is a red 'X' icon in the top right corner of the axis configuration area and a blue question mark icon next to the values field.

In the *Build* section of the configuration it is set the list of Jenkins subprojects to be triggered, in this case we have *decisionengine_pipeline* and *decisionengine_modules_pipeline*.

The *Parameters* text box is used to override parameters of each Jenkins subproject with a custom value.

In total this Jenkins project triggers 4 CI builds, i.e. 2 branches X 2 Jenkins subprojects.

The screenshot shows the Jenkins Build configuration page. The 'Build' tab is selected. Under the 'Trigger/call builds on other projects' section, the 'Projects to build' field is set to 'decisionengine_pipeline,decisionengine_modules_pipeline'. The 'Block until the triggered projects finish their builds' checkbox is unchecked. In the 'Predefined parameters' section, the 'Parameters' field is set to 'BRANCH=\${BRANCH}'. There are red 'X' icons in the top right corner of the 'Trigger/call builds on other projects' and 'Predefined parameters' sections, and blue question mark icons next to the 'Projects to build' and 'Parameters' fields.

Finally the *Build Triggers* section is used to setup the schedule for the periodic build, in this case it is scheduled to run at about 2 AM.

Jenkins will choose the actual time depending on the actual load on the system.

        Fetch the classad attributes specified in the format_list matching the constraint
    fetch_stored (constraint_func=None)
        Parameters constraint_func – A boolean function, with only one argument (data el). If
        None, return all the data.
        @rtype: dict @return: Same as fetch(), but limited to constraint_func(el)==True

```

`decisionengine_modules.htcondor.htcondor_query.bindings_friendly_attrs` (*format_list*)
Convert the *format_list* into *attrs* that can be used with python bindings Python bindings should take care of the typing

`decisionengine_modules.htcondor.htcondor_query.bindings_friendly_constraint` (*constraint*)
Convert the *constraint* to *format* that can be used with python bindings

`decisionengine_modules.htcondor.htcondor_query.eval_classad_expr` (*classads*, *format_list=None*)
Convert the *classads* into list of *classads* Guarantees any attribute in *format_list* to be added with default value *None*

`decisionengine_modules.htcondor.htcondor_query.list2dict` (*list_data*, *attr_name*)
Convert a list to a dictionary and group the results based on attributes specified by *attr_name*

`decisionengine_modules.htcondor.htcondor_query.resource_str_to_py_adtype` (*resource_str*)
Given the resource string return equivalent classad type

`decisionengine_modules.htcondor.htcondor_query.split_collector_host` (*collector_host*)
Given the *collector_host* string extract primary *collector_host* which is the first collector host in the list and sort the secondary collectors. Return a tuple of primary collector and CSV secondary collector.

decisionengine_modules.util package

Submodules

decisionengine_modules.util.figure_of_merit module

Calculate figure of merit

`decisionengine_modules.util.figure_of_merit.figure_of_merit` (*performance*,
running, *allowed*, *idle=None*,
max_idle=None)

decisionengine_modules.util.retry_function module

`decisionengine_modules.util.retry_function.retry_on_error` (*nretries=1*,
retry_interval=2,
backoff=True)

`decisionengine_modules.util.retry_function.retry_wrapper` (*f*, *nretries=1*,
retry_interval=2, *backoff=True*)

Retry on error with parameters of how many times (*nretries*) and interval in seconds (*retry_interval*). If the function to be decorated is an instance method and the values come from a configuration, then this decorator can retrieve these two parameters from instance attributes with the same name. Otherwise, use the default values or pass new values to the decorator.

decisionengine_modules.util.test_retry_function module

```

    func_success (foo, input2=3)
decisionengine_modules.util.test_retry_function.test_all()

```

decisionengine_modules.util.testutils module

Utils to simplify testing

```

decisionengine_modules.util.testutils.compare_dfs (df1, df2)
    for some reason df.equals does not work here but if I compare cell by cell it works :type df1: pd.DataFrame
    :arg df1: data frame instance :type df2: pd.DataFrame :arg df2: data frame instance :rtype: bool - True if
